

Supplementary Figure S1. Time-to-event curve for hospital mortality by Geriatric Nutritional Risk Index (GNRI) score in the elderly cohort. (A) Older adults with severe coronavirus disease 2019 (COVID-19) at risk of malnutrition showed no difference in the risk of hospital mortality compared with those with no-risk (generalized Wilcoxon test, $\chi^2=0.266$, $p=0.606$). (B) After propensity matching, older adults with severe COVID-19 at risk of malnutrition showed significantly higher mortality rates compared with those without risk (log rank test, $\chi^2=13.65$, $p<0.001$).
